Dear Sir/Madam,

To introduce myself, my name is Vasileios-Athanasios Anagnostopoulos and for me software development is a passion that started during my studies at the National Technical University of Athens (NTUA) as Geomatics engineer. For that reason, I joined the MSc program in Informatics at the University of Piraeus to focus on CS and grow my skills.

For the last one and half year, I have been working at ETH on a research project called "Location-Aware Mobile Eye Tracking for Tourist Assistance" (LAMETTA). LAMETTA is a research project on gaze-based interaction techniques in outdoor environments. During my stay at ETH, I developed a platform with C++ and OpenCV, that uses feature extraction and matching techniques from computer vision literature. A scientific journal has already published an article describing this platform under the title "Gaze-Informed Location Based Services".

I am a pragmatic, creative and passionate technologist with a positive attitude who looks forward to challenges. In addition to my enthusiasm, I possess sound competencies: a firm grasp of the Object-oriented paradigm and I am capable of programming in C++, Java, C#, PHP, JavaScript. I know how to use version control systems, such as git, so I can work and share code with other people. Furthermore, I am comfortable working with servers and Linux environments. Finally, I have worked with spatial data and Web-tools/technologies for the development of web geo-applications and I have some experience in the development of mobile applications using Android.

Having reached this far, now I am looking for new challenges. I would love to learn more about exciting jobs in an interview and, at the same time, give you a detailed insight into my capabilities and experience.

Yours sincerely,

**Vasileios-Athanasios
Anagnostopoulos**
